

## CSCI 665 Assignment 3

2. Consider  $a = [10, 20, 30, 40, 50]$  ;  $v = 50$

```
search([10, 20, 30, 40, 50]; 50)
= searchHelp([10, 20, 30, 40, 50], 50; 0, 4)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 4)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 3)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 3)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 3)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 3)
= searchHelp([10, 20, 30, 40, 50], 50; 2, 3)
Due to the incorrect Algorithm for binary search,
Here it is stuck on an infinite loop.
```

3.a.

$$S1 = B12 - B22 = 8 - 2 = 6$$

$$S2 = A11 + A12 = 1 + 3 = 4$$

$$S3 = A21 + A22 = 7 + 5 = 12$$

$$S4 = B21 - B11 = 4 - 6 = -2$$

$$S5 = A11 + A22 = 1 + 5 = 6$$

$$S6 = B11 + B22 = 6 + 2 = 8$$

$$S7 = A12 - A22 = 3 - 5 = -2$$

$$S8 = B21 + B22 = 4 + 2 = 6$$

$$S9 = A11 - A21 = 1 - 7 = -6$$

$$S10 = B11 + B12 = 6 + 8 = 14$$

The products are:

$$P1 = A11 * S1 = 1 * 6 = 6 \quad P2 = S2 * B22 = 4 * 2 = 8 \quad P3 = S3 * B11 = 12 * 6 = 72$$

$$P4 = A22 * S4 = 5 * -2 = -10$$

$$P5 = S5 * S6 = 6 * 8 = 48$$

$$P6 = S7 * S8 = -2 * 6 = -12$$

$$P7 = S9 * S10 = -6 * 14 = -84$$

The four matrices are:

$$C11 = P5 + P4 - P2 + P6 = 48 + (-10) - 8 + (-12) = 18$$

$$C12 = P1 + P2 = 6 + 8 = 14$$

$$C21 = P3 + P4 = 72 + (-10) = 62$$

$$C22 = P5 + P1 - P3 - P7 = 48 + 6 - 72 - (-84) = 66$$

Hence the resultant Matrix is:  $\begin{bmatrix} 18, 14 \\ 62, 66 \end{bmatrix}$

b. Strassen's Algorithm

MatMul(A, B)

```

n = A.rows
If n == 1
    C11 ← A11 * B11   Else
    S1 ← B12 - B22
    S2 ← A11 + A12
    S3 ← A21 + A22
    S4 ← B21 - B11
    S5 ← A11 + A22
    S6 ← B11 + B22
    S7 ← A12 - A22
    S8 ← B21 + B22
    S9 ← A11 - A21
    S10 ← B11 + B12

    P1 ← MatMul (A11,S1)  P2 ← MatMul (S2,B22)  P3 ← MatMul (S3,B11)  P4 ← MatMul
(A22,S4)  P5 ← MatMul (S5,S6)
    P6 ← MatMul (S7,S8)
    P7 ← MatMul (S9,S10)

    C11 ← P5 + P4 - P2 + P6   C12 ← P1 + P2   C21 ← P3 + P4   C22 ← P1 + P5 - P3 - P7
Return C

```

c.

Given:  $C21 = P3 + P4$

We know that,

```

P3 = S3 * B11
    = (A21 + A22) * B11
P4 = A22 * S4
    = A22 (B21 - B11)
P3 + P4
= (A21 + A22) * B11 + A22 (B21 - B11)
= A21* B11 + A22 * B11 + A22 * B21 - A22 * B11
= A21* B11 + A22 * B21
Hence proved.

```

(d)

Given:  $C22 = P5 + P1 - P3 - P7$

We know that,

```

P5 = S5 * S6
    = (A11 + A22) (B11 + B22)
    = A11 * B11 + A11 * B22 + A22 * B11 + A22 * B22
P1 = A11 * S1

```

$$\begin{aligned}
&= A_{11} (B_{12} - B_{22}) \\
&= A_{11} * B_{12} - A_{11} * B_{22} \\
P_3 &= S_3 * B_{11} \\
&= (A_{21} + A_{22}) B_{11} \\
&= A_{21} * B_{11} + A_{22} * B_{11} \\
P_7 &= S_9 * S_{10} \\
&= (A_{11} - A_{21}) (B_{11} + B_{12}) \\
&= A_{11} * B_{11} + A_{11} * B_{12} - A_{21} * B_{11} - A_{21} * B_{12} \\
P_5 + P_1 &= A_{11} * B_{11} + A_{11} * B_{22} + A_{22} * B_{11} + A_{22} * B_{22} + A_{11} * B_{12} - A_{11} * B_{22} \\
&= A_{11} * B_{11} + A_{22} * B_{11} + A_{22} * B_{22} + A_{11} * B_{12} \\
P_5 + P_1 - P_3 &= A_{11} * B_{11} + A_{22} * B_{11} + A_{22} * B_{22} + A_{11} * B_{12} - (A_{21} * B_{11} + A_{22} * B_{11}) \\
&= A_{11} * B_{11} + A_{22} * B_{22} + A_{11} * B_{12} - A_{21} * B_{11} \\
P_5 + P_1 - P_3 - P_7 &= A_{11} * B_{11} + A_{22} * B_{22} + A_{11} * B_{12} - A_{21} * B_{11} - (A_{11} * B_{11} + A_{11} * B_{12} - A_{21} * B_{11} - A_{21} * B_{12}) \\
&= A_{22} * B_{22} + A_{21} * B_{12} \\
&\text{Hence proved.}
\end{aligned}$$

e.

$$T(1) = 1$$

$$T(n) = 7 T(n/2) + 9/2 n^2$$

$$= 7 (7 T(n/2^2) + 9/2 (n/2)^2) + 9/2 n^2$$

$$= 7^2 T(n/2^2) + 7 \cdot 9/2 (n/2)^2 + 9/2 n^2$$

$$= 7^2 (7 T(n/2^3) + 9/2 (n/2^2)^2) + 7 \cdot 9/2 (n/2)^2 + 9/2 n^2$$

$$= 7^3 T(n/2^3) + 7^2 \cdot 9/2 (n/2^2)^2 + 7 \cdot 9/2 (n/2)^2 + 9/2 n^2$$

Identifying the pattern

$$= 7^k T(n/2^k) + 7^{k-1} \cdot 9/2 (n/2^{k-1})^2 + \dots + 7^0 \cdot 9/2 (n/2^0)^2$$

$$= 7^k T(2^m/2^k) + 7^{k-1} \cdot 9/2 (2^m/2^{k-1})^2 + \dots + 7^0 \cdot 9/2 (2^m/2^0)^2$$

$$= 7^k T(2^{m-k}) + 7^{k-1} \cdot 9/2 (2^{m-(k-1)})^2 + \dots + 7^0 \cdot 9/2 (2^{m-0})^2$$

consider  $k = m$

$$T(2^m) = 7^m T(2^{m-m}) + 7^{(k-1)} \frac{9}{2} (2^{m-(m-1)})^2 + \dots + 7^0 \frac{9}{2} (2^{m-0})^2$$

$$= 7^m T(1) + 7^{(k-1)} \frac{9}{2} (2^1)^2 + \dots + 7^0 \frac{9}{2} (2^m)^2$$

$$= 7^m + \frac{9}{2} \sum_{i=0}^{m-1} 7^i (2^{m-1})^2$$

$$= 7^m + \frac{9}{2} \sum_{i=0}^{m-1} 7^i (2^{2m-2})$$

$$= 7^m + \frac{9}{2} 2^m \sum_{i=0}^{m-1} (7 / (2^2))^i$$

$$= 7^m + \frac{9}{2} 2^m ((7 / (2^2))^m - 1) / (7/2^2 - 1)$$

$$= 7^m + \frac{9}{2} 2^m ((7^m / 2^{2m}) - 1)$$

$$= 7^m + \frac{9}{2} 2^m (7^m - 2^{2m}) / 2^{2m}$$

$$= 7^m + 6 (7^m / 2^m) - 2^m$$

$$T(n) = 7^m + 6 (7^m / n) - n$$

f.

Let  $m$  be the smallest power of 2 which is greater than  $n$ .

Then,

Adding  $(m-n)$  zeros to the  $n \times n$  matrices to make them  $m \times m$  matrices and perform multiplication using Strassen's algorithm.

Then the resulting algorithm will run at time.  $\Theta(n \lg(7))$

Hence Proved.

Suppose  $2^{(k-1)} < n < m = 2^k$ .

Now, we could extend original  $n \times n$  matrices to  $m \times m$  matrices by appending zeros for the Strassen's algorithm to work on extended matrices.

Then, to eliminate the appended elements from the matrices needs  $O(n^2)$ .

Because  $2^{(k-1)} < n$ , it follows that  $m < 2n$ . Therefore, the runtime becomes

$$\Theta((2n)^{\lg 7}) = \Theta(2^{\lg 7} n^{\lg 7}) = \Theta(n^{\lg 7})$$

(g)

The three multiplications are

$ac$ ,  $bd$  and  $(a + b)(c + d)$

Computing,

$$ac - bd + i((a+b)(c+d) - ac - bd)$$

$$ac - bd + i(ac + ad + bc + bd - ac - bd)$$

$$= ac - bd + i(ad + bc)$$

Hence the real component is  $ac - bd$  and imaginary component is  $ad + bc$

4.a.

For every even  $n \in \mathbb{N}$ , there exist some  $k \in \mathbb{N}$  such that  $n = 2k$ .

Then,  $\lceil (n + 1)/2 \rceil = \lceil (2k + 1)/2 \rceil$

$$= \lceil k + 1/2 \rceil$$

$$= k$$

$$= \lfloor k \rfloor$$

$$= \lfloor 2k/2 \rfloor$$

$$= \lfloor n/2 \rfloor, \text{ because } n = 2k$$

Same way for every odd  $n \in \mathbb{N}$ , there exist some  $k \in \mathbb{N}$  such that  $n = 2k + 1$ .

Then,  $\lceil (n + 1)/2 \rceil = \lceil ((2k + 1) + 1)/2 \rceil$

$$= \lceil (2k + 2)/2 \rceil$$

$$= \lceil k + 1 \rceil$$

$$= k + 1$$

$$= \lceil k + 1/2 \rceil$$

$$= \lceil (2k + 1)/2 \rceil$$

$$= \lceil n/2 \rceil, \text{ because } n = 2k + 1$$

So, for any  $n \in \mathbb{N}$ ,  $\lceil (n + 1)/2 \rceil = \text{ceil of } (n/2)$

b.

For every even  $n \in \mathbb{N}$ , there exist some  $k \in \mathbb{N}$  such that  $n = 2k$ .

Then,  $\lfloor n/2 \rfloor + 1 = \lfloor 2k/2 \rfloor + 1$

$$= \lfloor 2k/2 \rfloor + 1$$

$$= \lfloor k \rfloor + 1$$

$$= k + 1$$

$$= \lfloor k + \frac{1}{2} \rfloor$$

$$= \lfloor (2k + 1)/2 \rfloor$$

$$= \lfloor (n + 1)/2 \rfloor, \text{ because } n = 2k$$

Same way for every odd  $n \in \mathbb{N}$ , there exist some  $k \in \mathbb{N}$  such that  $n = 2k + 1$ .

Then,  $\lfloor n/2 \rfloor + 1$

$$= \lfloor (2k + 1)/2 \rfloor + 1$$

$$= \lfloor k + \frac{1}{2} \rfloor + 1$$

$$= \lfloor k \rfloor + 1$$

$$= k + 1$$

$$= \lfloor k + 1 \rfloor$$

$$= \lfloor 2(k + 1)/2 \rfloor$$

$$= \lfloor (2k + 2)/2 \rfloor$$

$$= \lfloor ((2k + 1) + 1)/2 \rfloor$$

$$= \lfloor (n + 1)/2 \rfloor, \text{ because } n = 2k + 1$$

So, for any  $n \in \mathbb{N}$ ,  $\lfloor n/2 \rfloor + 1 = \text{ceil of } (n + 1)/2$

c.

Given  $D(n) = T(n + 1) \cdot T(n)$

$$\begin{aligned}
\text{So, } D(1) &= T(1 + 1) - T(1) \\
&= T(2) - T(1) \\
&= T(2) - 0 = T(2) \\
&= T(\lfloor 2/2 \rfloor) + T(\lfloor 2/2 \rfloor) + 2, \text{ From recurrence definition} \\
&= T(\lfloor 1 \rfloor) + T(\lfloor 1 \rfloor) + 2 \\
&= T(1) + T(1) + 2 \\
&= 0 + 0 + 2 \\
&= 2
\end{aligned}$$

$$\begin{aligned}
\text{Now, } D(n) &= T(n + 1) - T(n) \\
T(n) &= T(\lfloor (n + 1)/2 \rfloor) + T(\lfloor (n + 1)/2 \rfloor) + (n + 1) - (T(\lfloor n/2 \rfloor) + T(\lfloor n/2 \rfloor) + n) \\
&\text{, by recurrence definition} \\
&= T(\lfloor (n + 1)/2 \rfloor) - T(\lfloor n/2 \rfloor) + 1 \\
&\text{, putting value from 4.a.} \\
&= T(\lfloor n/2 \rfloor + 1) - T(\lfloor n/2 \rfloor) + 1 = T(\lfloor n/2 \rfloor) + 1, \text{ putting value from 4.b} \\
&= T(\lfloor n/2 \rfloor + 1) - T(\lfloor n/2 \rfloor) + 1 \\
&= D(\lfloor n/2 \rfloor) + 1, \text{ by definition of } D(n)
\end{aligned}$$

d.

By the strong form of mathematical induction.

Observe  $D(1) = 2$ , from 3.c

$$= 0 + 2 = \lfloor \lg 1 \rfloor + 2$$

Assume  $D(k) = \lfloor \lg(k) \rfloor + 2$  if  $0 < k < n$

Now,

$$D(n) = D(\lfloor n/2 \rfloor) + 1, \text{ from 3.c}$$

Suppose,  $\lfloor n/2 \rfloor = k$  for any  $k \in \mathbb{N}$  and  $k \geq 1$

$$\text{So, } D(n) = D(\lfloor k \rfloor) + 1$$

$$= D(\lfloor k \rfloor) + 1$$

$$= \lfloor \lg k \rfloor + 2 + 1, \text{ by assumption}$$

$$= \lfloor \lg(n/2) \rfloor + 2 + 1, \text{ because } k = n/2$$

$$= \lfloor \lg n - \lg 2 \rfloor + 2 + 1$$

$$= \lfloor \lg n - 1 \rfloor + 2 + 1$$

$$= \lfloor \lg n \rfloor - \lfloor 1 \rfloor + 2 + 1, \text{ for any } n \in \mathbb{N}, \lfloor \lg n - 1 \rfloor$$

$$= \lfloor \lg n \rfloor - \lfloor 1 \rfloor$$

$$= \lfloor \lg n \rfloor + 2$$

e.

$$T(n) - T(1) = T(n) - T(n - 1) + T(n - 1) - T(n - 2) + T(n - 2) - \dots + T(3) - T(2) + T(2) - T(1)$$

$$= D(n - 1) + D(n - 2) + \dots + D(2) + D(1), \text{ from definition of } D(n)$$

$$= D(1) + D(2) + \dots + D(n - 2) + D(n - 1)$$

$$= \sum_{k=1}^{n-1} D(k)$$

$$\text{Hence, } T(n) - T(1) = \sum_{k=1}^{n-1} D(k)$$

Here,  $T(1) = 0$ , and from 4.d. we conclude our immediate consequence is

$$T(n) = \sum_{k=1}^{n-1} \lfloor \lg k \rfloor + 2$$

f.

$$T(n) = n - 1 \sum_{k=1}^n [\lg k] + 2$$

$= n \sum_{k=1}^n [\lg k] + 2 - ([\lg n] + 2)$  , adding  $n$ th term to change the limit

$$= (([\lg 1] + 2) + ([\lg 2] + 2) + \dots + ([\lg n] + 2)) - ([\lg n] + 2)$$

$$= (([\lg 1] + [\lg 2] + \dots + [\lg n]) + 2n) - ([\lg n] + 2)$$

$= (([\lg 1 + \lg 2 + \dots + \lg n]) + 2n) - ([\lg n] + 2)$  , for arbitrary larger  $n$  combining all sums of log into a single floor.

$$= ([\lg(n!)] + 2n) - ([\lg n] + 2)$$

$$= [\lg(n!)] - [\lg n] + 2n - 2$$

$$= [\lg(n!)] - [\lg n] + 2(n - 1)$$

Time complexity of above equation in terms of Big-O =  $O(n \lg(n)) - O(\lg n) + O(n)$

So, overall time complexity of  $T(n) = O(n \log(n))$ .
